## Corrosive Sulfur in Transformer Insulating Mineral Oil: What is it and how to prevent the Adverse Effect

### Fabio Scatiggio

Trasmissione Elettricità Rete Nazionale S.p.A

Fabio Scatiggio was born in Venezia, Italy, in 1957. He is with Terna Rete Italia where he is in charge as Chemical Laboratory Manager.

He is the Italian representative in many IEC TC 10 and CIGRE A2&D1 working groups. Mr. Scatiggio has published many papers on transformers diagnosis by DGA and on problems related with presence of corrosive sulphur in oil.

Mr. Scatiggio received the "IEC Award 1906" in 2008 and was awarded as "CIGRE Distinguished Member" in 2012.

Corrosive Sulfur in Transformer Insulating Mineral Oil

## Historical background

The term of corrosive sulfur identifies those forms of sulfur that are corrosive under normal operating thermal conditions of the transformers.

Some of sulfur compounds are beneficent to the oil because they act as retardants or passivants in the oxidation process (“good sulphur”)

CONFERENCE**

**Corrosive Sulfur in Transformer Insulating Mineral Oil:  
What is it and how to prevent the Adverse Effect**

Transformer Life Management 2014  
Corrosive Sulfur in Transformer Insulating Mineral Oil

**Historical background**

Not all the sulfur is reactive

Element	Chemical Structure	Reactivity
Mercaptans	R-S-R <sub>1</sub>	highly reactive
Sulphides (thioethers)	R-S-R <sub>1</sub>	reactive
Disulphides	R-S-S-R	stable/reactive
Thiophenes	5 membered ring with S	very stable

Transformer Life Management 2014  
Corrosive Sulfur in Transformer Insulating Mineral Oil

**Test Methods**

International standard organizations have adopted, since the '50s, a simple ON/OFF test to detect the corrosiveness of the oils

Method	Description
ASTM D130 – IP 154 – ISO 2160	COPPER STRIP AT 100°C
ASTM D1275/A - ISO 5662 - NBR 1505	COPPER STRIP AT 140°C FOR 19 HOURS
DIN 51353	SILVER STRIP AT 100°C FOR 18 HOURS
TERNA (Extended ASTM D1275)	COPPER STRIP AT 140°C FOR 48 OR 72 HOURS
DOBLE - ASTM D1275/B	COPPER STRIP AT 150°C FOR 48 HOURS
CCD (Covered Conductor Discoloration Test) IEC62535	COPPER AND PAPER STRIP AT 150°C FOR 72 HOURS

## DBDS' behavior with copper

Oils containing DBDS were subjected to copper-to-oil reaction under the conditions prescribed in ASTM D 1275.

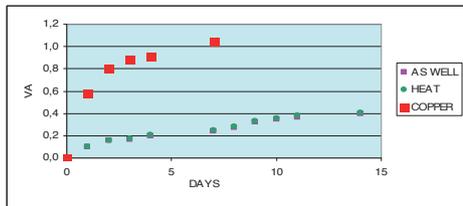

Radisson Royal Hotel- Dubai – 2014 October 28-29

11

Transformer Life Management 2014  
Corrosive Sulfur in Transformer Insulating Mineral Oil

## DBDS and oxidation stability

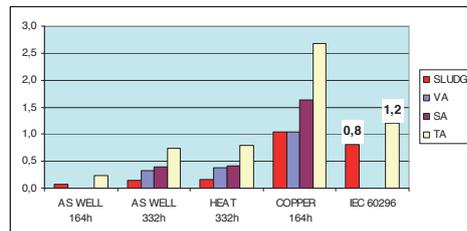

Oxidation stability tests were performed accordingly with IEC 61125 C, on unused oils containing DBDS. The same oil was tested again for oxidative stability.

**AS WELL:** oil with DBDS, untreated  
**HEAT:** oil with DBDS pretreated 3 days at 140°C  
**COPPER:** oil with DBDS pretreated 3 days at 140°C with copper

The oil meets IEC 60296 requirements as new and even after thermal stress.

After the reaction with copper (and consequent DBDS consumption) oxidation stability falls to unacceptable values.

## DBDS and oxidation stability

From “Lubricant Additives – Chemistry and Application” 2<sup>nd</sup> Edition 2008 –  
page 5 – Edited by Leslie R. Rudnik – CRC Press

The initial concepts of using antioxidants to inhibit oil oxidation date back to the 1800s. One of the earliest inventions described in the literature [1] is the heating of a mineral oil with elemental sulfur to produce a non-oxidizing oil. However, the major drawback to this approach is the high corrosivity of the sulfurized oil toward copper. Aliphatic sulfide with a combined antioxidant and corrosion inhibition characteristics was developed by sulfurizing sperm oil [2]. Additives with similar functionalities could also be obtained from sulfurizing terpenes and polybutene [3–5]. Paraffin wax has also been employed to prepare sulfur compounds [6–9]. Theoretical structures of several sulfur compounds are illustrated in Figure 1.1. Actual compounds can be chemically complex in nature.

Aromatic sulfides represent another class of sulfur additives used as oxidation and corrosion inhibitors. Examples of simple sulfides are dibenzyl sulfide and dixylyldisulfide.

Corrosive Sulfur in Transformer Insulating Mineral Oil

### Mitigation Techniques

#### EQUIPMENT

- Winding replacement (high economic impact)
- Cooling improvement (only some cases).

#### OIL

- Oil passivation with Irgamet 39 (worldwide used, but 38% of breakdown in Terna-Brazil experience)
- Oil retrofilling (no faults)
- Chemical – Selective Depolarization (DBDS elimination).

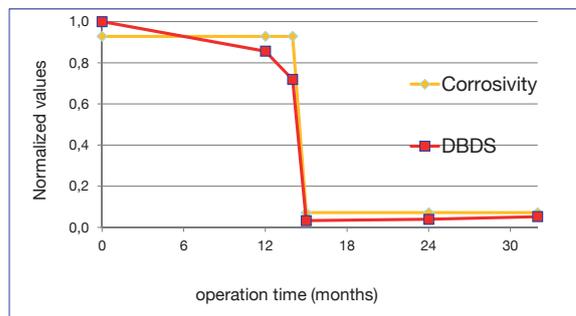

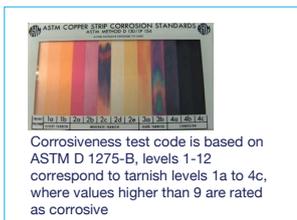

Radisson Royal Hotel- Dubai – 2014 October 28-29

Transformer Life Management 2014  
Corrosive Sulfur in Transformer Insulating Mineral Oil

Passivation: silver corrosion

- 230/130 kV 150 MVA Transmission TR:
- Age: 5 years
  - Filled in 2005 with Italian oil, later discovered as corrosive (DBDS: 150 ppm)
  - Passivated two years later in 2007
  - No Irgamet 39 depletion over the years
  - Failed in February 2010
  - Inspected in May 2010, by manhole

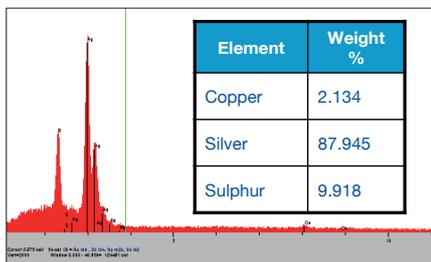

Radisson Royal Hotel- Dubai – 2014 October 28-29

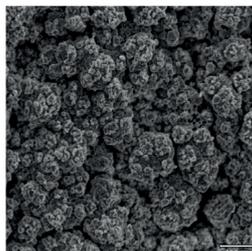

25

Transformer Life Management 2014  
Corrosive Sulfur in Transformer Insulating Mineral Oil

Passivation: silver corrosion

SEM/EDX

Mechanism:

- Pre-selector OLTC's copper parts are not corroded
- Pre-selector OLTC's silver parts are completely corroded
- Build-up of  $Ag_2S$  on the conductor surface until the film becomes mechanically unstable
- Transportation of  $Ag_2S$  particles
- Breakdown at power frequency and rated voltage stress?

Radisson Royal Hotel- Dubai – 2014 October 28-29

Corrosive Sulfur in Transformer Insulating Mineral Oil

**Passivation**

Most widely mitigation action used  
Found to be effective in the large majority of cases  
Some cases of failure, where critical conditions for instability did exist. Some evidences come from:

- Brazil, 9 shunt reactors failed in a range of 1 ÷ 22 months later
- Brazil, 1 GSU (hydraulic) failed after passivation
- USA, 1 GSU (thermal) failed after 1 year from passivation

	Corrosiveness persistence	Irgamet 39 consumption	Stray gassing			
			H <sub>2</sub>	CO	CO <sub>2</sub>	C <sub>x</sub> H <sub>y</sub>
%	8	39	33	16	16	4

Radisson Royal Hotel- Dubai – 2014 October 28-29

27

**Transformer Life Management 2014**  
Corrosive Sulfur in Transformer Insulating Mineral Oil

**Selective Depolarization**

Industrial application:

- more than 250 transformers
- several kTons of oil treated

Principles of the process:

- The process is performed on-site
- The process is performed in closed-circuit, without emptying the unit even partially
- The process can be operated on loaded transformers, up to 500 kV of rated voltage
- The oil is firstly forced through a solid chemical reagent that convert DBDS and other corrosive compounds in a more polar by-product
- A second step of solid reagents blocks the corrosive compounds previously converted
- The oil is submitted to degassing and de-humidification before reverting back in the transformer
